

Agenda Item 8

REVISED ANNEX B

ECONOMIC OUTLOOK – LINK ASSET SERVICES LTD

- **UK.** The Bank of England's Monetary Policy Committee (MPC) kept **Bank Rate** and quantitative easing (QE) unchanged on 4th February. However, it revised its economic forecasts to take account of a third national lockdown which started on 5th January, which is obviously going to delay economic recovery and do further damage to the economy. Moreover, it had already decided in November to undertake a further tranche of quantitative easing (QE) of £150bn, to start in January when the previous programme of £300bn of QE, announced in March to June 2020, finished. As only about £16bn of the latest £150bn tranche had been used towards the end of January, it felt that there was already sufficient provision for QE - which would be made to last to the end of 2021. This implied that the current rate of purchases of £4.4bn per week would be slowed during the year.
- Although its short-term forecasts were cut for 2021, the medium-term forecasts were more optimistic than in November, based on an assumption that the current lockdown will be gradually eased after Q1 as vaccines are gradually rolled out and life can then start to go back to some sort of normality. The Bank's main assumptions were:
 - The economy would start to **recover strongly** from Q3 2021.
 - **£125bn of savings** made by consumers during the pandemic will give a significant boost to the pace of economic recovery once lockdown restrictions are eased and consumers can resume high street shopping, going to pubs and restaurants and taking holidays.
 - The economy would still recover to reach its **pre-pandemic level** by Q1 2022 despite a long lockdown in Q1 2021.
 - **Spare capacity** in the economy would be eliminated in Q1 2022.
 - The Bank also expects there to be **excess demand** in the economy by Q4 2022.
 - **Unemployment** will peak at around 7.5% during late 2021 and then fall to about 4.2% by the end of 2022. This forecast implies that 0.5m foreign workers will have been lost from the UK workforce by their returning home.
 - **CPI inflation** was forecast to rise quite sharply towards the 2% target in Q1 2021 due to some temporary factors, (e.g. the reduction in VAT for certain services comes to an end) and given developments in energy prices. CPI inflation was projected to be close to 2% in 2022 and 2023.
- The Monetary Policy Report acknowledged that there were **downside risks** to their forecasts e.g. from virus mutations, will vaccines be fully effective, how soon can tweaked vaccines be devised and administered to deal with mutations? There are also issues around achieving herd immunity around the world from this virus so that a proliferation of mutations does not occur which prolong the time it takes for the global economy to fully recover.
- The Report also mentioned a potential **upside risk** as an assumption had been made that consumers would only spend £6bn of their savings of £125bn once restrictions were eased. However, the risk is that that consumers could spend a lot more and more quickly.
- The Bank of England also removed **negative interest rates** as a possibility for at least six months as financial institutions were not yet ready to implement them. As in six months' time the economy should be starting to grow strongly, this effectively

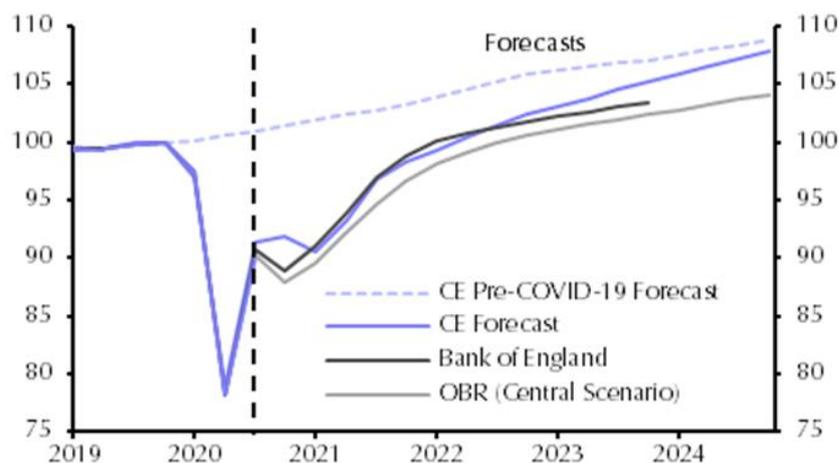

means that negative rates occurring are only a slim possibility in the current downturn. However, financial institutions have been requested to prepare for them so that, at a future time, this could be used as a monetary policy tool if deemed appropriate. (**Gilt yields and PWLB rates** jumped upwards after the removal of negative rates as a key risk in the short-term.)

- Prior to 4th February, the **MPC's forward guidance** outlined that the sequencing of a withdrawal of monetary policy support would be that Bank Rate would be increased first, and only once it had reached a certain level, 'around 1.5%', before a start would be made on winding down the stock of asset purchases made under QE. However, the MPC decided at the February meeting that this policy should be reviewed as to whether a start should be made first on **winding down QE** rather than raising Bank Rate.
- The MPC reiterated its previous guidance that Bank Rate would not rise until inflation was sustainably above 2%. This means that it will tolerate inflation running above 2% from time to time to balance out periods during which inflation was below 2%. This is termed **average inflation targeting**.
- **There are two views in respect of Bank Rate beyond our three-year time horizon:**
 1. The MPC will be keen to raise Bank Rate as soon as possible in order for it to be a usable tool when the next economic downturn comes along. This is in line with thinking on Bank Rate over the last 20 years.
 2. Conversely, that we need to adjust to the new post-pandemic era that we are now in. In this new era, the shift to average inflation targeting has set a high bar for raising Bank Rate i.e. only when inflation is demonstrably sustainably above 2%. In addition, many governments around the world have been saddled with high levels of debt. When central bank rates are low, and below the average GDP growth rate, the debt to GDP ratio will gradually fall each year without having to use fiscal tools such as raising taxes or austerity programmes, (which would depress economic growth and recovery). This could therefore result in governments revising the setting of mandates to their national central banks to allow a higher rate of inflation linked to other economic targets. This is the Capital Economics view – that Bank Rate will not rise for the next five years and will probably then struggle to get to 1% within 10 years.
- **Public borrowing** was forecast in November 2020 by the Office for Budget Responsibility (the OBR) to reach £394bn in the current financial year, the highest ever peace time deficit and equivalent to 19% of GDP. In normal times, such an increase in total gilt issuance would lead to a rise in gilt yields, and so PWLB rates. However, the QE done by the Bank of England has depressed gilt yields to historic low levels, (as has similarly occurred with QE and debt issued in the US, the EU and Japan). This means that new UK debt being issued, and this is being done across the whole yield curve in all maturities, is locking in those historic low levels through until maturity. In addition, the UK has one of the longest average maturities for its entire debt portfolio, of any country in the world. Overall, this means that the total interest bill paid by the Government is manageable despite the huge increase in the total amount of debt. The OBR was also forecasting that the government will still be running a budget deficit of £102bn (3.9% of GDP) by 2025/26. However, initial impressions are that they have taken a pessimistic view of the impact that vaccines could make in the speed of economic recovery. It is now likely that total borrowing will

probably reach around £420bn due to further Government support measures introduced as a result of further restrictions and the third national lockdown.

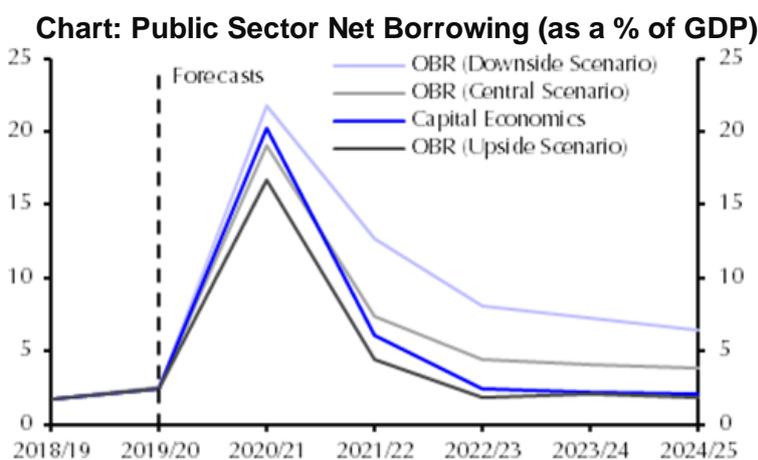

- Overall, **the pace of recovery** was not expected to be in the form of a rapid V shape, but a more elongated and prolonged one. The initial recovery was sharp after quarter 1 saw growth at -3.0% followed by -18.8% in quarter 2 and then an upswing of +16.0% in quarter 3; this still left the economy 8.6% smaller than in Q4 2019. While the one month second national lockdown that started on 5th November caused a further contraction of 5.7% m/m in November, this was much better than had been feared and showed that the economy is adapting to new ways of working. This left the economy 'only' 8.6% below the pre-crisis level. However, a strong recovery from a further contraction during quarter 1 2021 is expected in the second half of 2021 and is likely to mean that the economy recovers to its pre-pandemic level during Q1 2022.
- **Vaccines – the game changer.** The Pfizer announcement on 9th November of a successful vaccine has been followed by approval of the Oxford University/AstraZeneca and Moderna vaccines. The Government has set a target to vaccinate 14 million people in the most at risk sectors of the population by 15th February; it has made good, and accelerating progress in hitting that target. The aim is also to vaccinate all over 50s by May and all adults by September. This means that the national lockdown starting in early January, could be replaced by regional tiers of lighter restrictions, beginning possibly in Q2. At that point, there would be less reason to fear that hospitals could become overwhelmed any more. Effective vaccines have radically improved the economic outlook so that it may now be possible for GDP to recover to its pre-virus level as early as Q1 2022. These vaccines have enormously boosted confidence that **life could largely return to normal during the second half of 2021**. With the household saving rate having been exceptionally high since the first lockdown in March, there is plenty of pent-up demand and purchasing power stored up for when life returns to normal.
- Provided that both monetary and fiscal policy are kept loose for a few years yet, then it is still possible that **in the second half of this decade**, the economy may be no smaller than it would have been if COVID-19 never happened. The major concern though, is that new mutations of the virus might defeat the current batch of vaccines. However, work is already advanced to produce what may well become annual revaccinations each autumn with updated vaccines. In addition, countries around the world have ramped up vaccine production facilities and vastly improved testing regimes; they are therefore now much better equipped to deal effectively with any new outbreaks of mutations of this virus.

Chart: Level of real GDP (Q4 2019 = 100)

(if unable to print in colour..... the key describing each line in the above graph is in sequential order from top to bottom in parallel with the lines in the graph.

This recovery of growth which eliminates the effects of the pandemic by about the middle of the decade, would have major repercussions for public finances as it would be consistent with the government deficit falling to around 2.5% of GDP without any tax increases. This would be in line with the OBR's most optimistic forecast in the graph below, rather than their current central scenario which predicts a 4% deficit due to assuming much slower growth. However, Capital Economics forecasts in the graphs above and below, assumed that politicians do not raise taxes or embark on major austerity measures and so, (perversely!), depress economic growth and recovery.

(if unable to print in colour..... the key describing each line in the above graph is in sequential order from top to bottom in parallel with the lines in the graph.

- There will still be some **painful longer term adjustments** as e.g. office space and travel by planes, trains and buses may not recover to their previous level of use for several years, or possibly ever, even if vaccines are fully successful in overcoming the current virus. There is also likely to be a **reversal of globalisation** as this crisis has exposed how vulnerable long-distance supply chains are. On the other hand, **digital services** are one area that has already seen huge growth.
- **Brexit.** The final agreement of a trade deal on 24.12.20 has eliminated a significant downside risk for the UK economy. The initial agreement only covers trade so there is further work to be done on the services sector where temporary equivalence has been granted in both directions between the UK and EU; that now needs to be formalised on a permanent basis. However, it is evident from problems with trade flows at ports in January and February, that work needs to be done to smooth out the issues and problems that have been created by complex customs paperwork, in order to deal with bottle necks currently being caused.
- **Fiscal policy.** In December, the Chancellor made a series of announcements to provide further support to the economy: -
 - An extension of the COVID-19 loan schemes from the end of January 2021 to the end of March.
 - The furlough scheme was lengthened from the end of March to the end of April.

- The Budget on 3.3.21 will lay out the “next phase of the plan to tackle the virus and protect jobs”. This does not sound like tax rises are imminent, (which could hold back the speed of economic recovery).
- The **Financial Policy Committee** (FPC) report on 6.8.20 revised down the expected credit losses for the banking sector to “somewhat less than £80bn”. It stated that in its assessment, “banks have buffers of capital more than sufficient to absorb the losses that are likely to arise under the MPC’s central projection”. The FPC stated that for real stress in the sector, the economic output would need to be twice as bad as the MPC’s projection, with unemployment rising to above 15%.
- **US.** Following elections for two senate seats in January, the Democrats now have a majority in the House of Representatives and a very slim majority in the Senate based on the vice president’s casting vote. As the Democrats will be dependent on gaining the support of moderate Democrat senators, there will be a limit on just how radical they can be with their legislative and financial programmes. The \$900bn fiscal stimulus passed in December will help the economy gain more traction in early 2021. There is a question mark, however, over whether they will be able to get a much bigger \$1.9bn fiscal stimulus through both houses, though a smaller package would stand much more chance of being approved. The rapid roll out of vaccines is well on course to vaccinate nearly the entire population by the end of the summer; this will help to underpin a strong economic recovery in 2021 after the economy wilted during Q4 2020 as more restrictions were imposed to contain the pandemic.
- After Chair Jerome Powell unveiled the **Fed's adoption of a flexible average inflation target** in his Jackson Hole speech in late August 2020, the mid-September meeting of the Fed agreed by a majority to a toned down version of the new inflation target in his speech - that *"it would likely be appropriate to maintain the current target range until labour market conditions were judged to be consistent with the Committee's assessments of maximum employment and inflation had risen to 2% and was on track to moderately exceed 2% for some time."* This change was aimed to provide more stimulus for economic growth and higher levels of employment and to avoid the danger of getting caught in a deflationary “trap” like Japan. It is to be noted that inflation has actually been under-shooting the 2% target significantly for most of the last decade, (and in 2020), so financial markets took note that higher levels of inflation are likely to be in the pipeline; long-term bond yields duly rose after the meeting. The FOMC’s updated economic and rate projections in mid-September showed that under this new regime of average inflation targeting, that officials expected to leave the fed funds rate at near-zero until at least end-2023 and probably for another year or two beyond that. Where the Fed has led in changing its monetary policy to one based on average inflation targeting in response to the damage that this pandemic has done to the economy, there was much expectation that other major central banks would also follow suit.
- Subsequent meetings of the Fed have projected that **inflation** will not get back sustainably to above 2% for some years and so the vast majority of Fed officials expect the Fed funds rate to still be at near-zero until 2024 or later. The key message is that policy will remain unusually accommodative – with near-zero rates and asset purchases continuing for several more years. This is likely to result in keeping Treasury yields lower than might otherwise be expected, although treasury yields have increased somewhat due to financial markets adjusting to expectations of higher rates of inflation.
- **EU.** The economy was recovering well from the first lockdowns towards the end of Q2 and during Q3 after a sharp drop in GDP. However, a second wave of the virus has

caused a renewed fall back in growth during Q4. The slow roll out of vaccines during Q1 2021 will delay economic recovery. In Q2 of 2020, GDP was 15% below its pre-pandemic level. But in Q3 the economy grew by 12.5% q/q leaving GDP down by “only” 4.4%. That was much better than had been expected earlier in the year. However, growth contracted by another 0.7% in Q4 and is likely to at least stagnate during Q1 of 2021, as a second wave of the virus has seriously affected many countries. The €750bn fiscal support package eventually agreed by the EU after prolonged disagreement between various countries, is unlikely to provide significant support, and quickly enough, to make an appreciable difference in the countries most affected by the first wave.

- With **inflation** expected to be unlikely to get much above 1% over the next two years, **the ECB** has been struggling to get inflation up to its 2% target. It is currently unlikely that it will cut its central rate even further into negative territory from -0.5%, although the ECB has stated that it retains this as a possible tool to use. The ECB’s December meeting added a further €500bn to the PEPP scheme, (purchase of government and other bonds), and extended the duration of the programme to March 2022 and re-investing maturities for an additional year until December 2023. Three additional tranches of TLTRO, (cheap loans to banks), were approved, indicating that support will last beyond the impact of the pandemic, implying indirect yield curve control for government bonds for some time ahead. The Bank’s forecast for a return to pre-virus activity levels was pushed back to the end of 2021, but stronger growth is projected in 2022. The total PEPP scheme of €1,850bn of QE which started in March 2020 is providing protection to the sovereign bond yields of weaker countries like Italy. There is therefore unlikely to be a euro crisis while the ECB is able to maintain this level of support. However, as in the UK and the US, the advent of highly effective vaccines will be a game changer once the EU can get a comprehensive vaccination scheme up and running, although growth will struggle before later in quarter 2 of 2021.
- **China.** After a concerted effort to get on top of the virus outbreak in Q1, economic recovery was strong in the rest of 2020; this has enabled China to recover all of the contraction in Q1. Policy makers have both quashed the virus and implemented a programme of monetary and fiscal support that has been particularly effective at stimulating short-term growth. At the same time, China’s economy has benefited from the shift towards online spending by consumers in developed markets. These factors help to explain its comparative outperformance compared to western economies. However, this was achieved by major central government funding of yet more infrastructure spending. After years of growth having been focused on this same area, any further spending in this area is likely to lead to increasingly weaker economic returns in the longer term. This could, therefore, lead to a further misallocation of resources which will weigh on growth in future years.
- **Japan.** A third round of fiscal stimulus in early December took total fresh fiscal spending this year in response to the virus close to 12% of pre-virus GDP. That’s huge by past standards, and one of the largest national fiscal responses. The budget deficit is now likely to reach 16% of GDP this year. Coupled with Japan’s relative success in containing the virus without draconian measures so far, and the likelihood of effective vaccines being available in the coming months, the government’s latest fiscal effort should help ensure a strong recovery and to get back to pre-virus levels by Q3 2021 – around the same time as the US and much sooner than the Eurozone. However, on the negative side, it has also been struggling - despite huge monetary and fiscal stimulus - to get out of a deflation trap for many years and to achieve consistent, significant GDP growth. Moreover, it has not consistently managed to raise inflation up to its target level of 2% and it is making little progress on fundamental reform of the economy.

- **World growth.** World growth has been in recession in 2020 and this is likely to continue into the first half of 2021 before recovery in the second half. Inflation is unlikely to be a problem for some years due to the creation of excess production capacity and depressed demand caused by the coronavirus crisis.
- Until recent years, world growth has been boosted by increasing **globalisation** i.e. countries specialising in producing goods and commodities in which they have an economic advantage and which they then trade with the rest of the world. This has boosted worldwide productivity and growth, and, by lowering costs, has also depressed inflation. However, the rise of China as an economic superpower over the last thirty years, which now accounts for nearly 20% of total world GDP, has unbalanced the world economy. The Chinese government has targeted achieving major world positions in specific key sectors and products, especially high tech areas and production of rare earth minerals used in high tech products. It is achieving this by massive financial support, (i.e. subsidies), to state owned firms, government directions to other firms, technology theft, restrictions on market access by foreign firms and informal targets for the domestic market share of Chinese producers in the selected sectors. This is regarded as being unfair competition that is putting western firms at an unfair disadvantage or even putting some out of business. It is also regarded with suspicion on the political front as China is an authoritarian country that is not averse to using economic and military power for political advantage. The current trade war between the US and China therefore needs to be seen against that backdrop. It is, therefore, likely that we are heading into a period where there will be a **reversal of world globalisation and a decoupling of western countries** from dependence on China to supply products. This is likely to produce a backdrop in the coming years of weak global growth and so weak inflation.

Summary

Central banks are, therefore, likely to support growth by maintaining loose monetary policy through keeping rates very low for longer. Governments could also help a quicker recovery by providing more fiscal support for their economies at a time when total debt is affordable due to the very low rates of interest. They will also need to avoid significant increases in taxation or austerity measures that depress demand and the pace of recovery in their economies.

If there is a huge surge in investor confidence as a result of successful vaccines which leads to a major switch out of government bonds into equities, which, in turn, causes government debt yields to rise, then there will be pressure on central banks to actively manage debt yields by further QE purchases of government debt; this would help to suppress the rise in debt yields and so keep the total interest bill on greatly expanded government debt portfolios within manageable parameters. It is also the main alternative to a programme of austerity.

INTEREST RATE FORECASTS

The balance of risks to the UK

- The overall balance of risks to economic growth in the UK is now probably more to the upside but is subject to major uncertainty due to the virus - both domestically and its potential effects worldwide.

- There is relatively little domestic risk of increases or decreases in Bank Rate in the near-term, nor significant changes in shorter-term PWLB rates. The Bank of England has effectively ruled out the use of negative interest rates anytime soon but increases in Bank Rate are likely to be some years away given the underlying economic expectations. However, it is always possible that safe haven flows, due to unexpected domestic developments and those in other major economies, could impact gilt yields, (and so PWLB rates).

Downside risks to current forecasts for UK gilt yields and PWLB rates currently include:

- **Mutations** of the virus render current vaccines ineffective, and tweaked vaccines to combat these mutations are delayed, resulting in further national lockdowns or severe regional restrictions.
- **UK government** takes too much action too quickly to raise taxation or introduce austerity measures that depress demand and the pace of recovery of the economy.
- **UK - Bank of England** takes action too quickly, or too far, over the next three years to raise Bank Rate and causes UK economic growth, and increases in inflation, to be weaker than we currently anticipate.
- **UK / EU trade arrangements** – if there was a major impact on trade flows due to complications with customs paperwork or lack of co-operation in sorting out significant issues. A resurgence of the **Eurozone sovereign debt crisis**. The ECB has taken monetary policy action to support the bonds of EU states, with the positive impact most likely for “weaker” countries. In addition, the EU agreed a €750bn fiscal support package. These actions will help shield weaker economic regions for the next two or three years. However, in the case of Italy, the cost of the virus crisis has added to its already huge debt mountain and its slow economic growth will leave it vulnerable to markets returning to taking the view that its level of debt is unsupportable. There remains a sharp divide between northern EU countries favouring low debt to GDP and annual balanced budgets and southern countries who want to see jointly issued Eurobonds to finance economic recovery. This divide could undermine the unity of the EU in time to come.
- Weak capitalisation of some **European banks**, which could be undermined further depending on extent of credit losses resultant of the pandemic.
- **German minority government & general election in 2021**. In the German general election of September 2017, Angela Merkel’s CDU party was left in a vulnerable minority position dependent on the fractious support of the SPD party, as a result of the rise in popularity of the anti-immigration AfD party. Angela Merkel has stepped down from being the CDU party leader but she will remain as Chancellor until the general election in 2021. This then leaves a major question mark over who will be the major guiding hand and driver of EU unity when she steps down.
- **Other minority EU governments**. Italy, Spain, Austria, Sweden, Portugal, Netherlands, Ireland and Belgium also have vulnerable minority governments dependent on coalitions which could prove fragile.
- **Austria, the Czech Republic, Poland and Hungary** now form a strongly anti-immigration bloc within the EU, and they had threatened to derail the 7 year EU budget until a compromise was thrashed out in late 2020. There has also been a rise in anti-immigration sentiment in Germany and France.

- **Geopolitical risks**, for example in China, Iran or North Korea, but also in Europe and other Middle Eastern countries, which could lead to increasing safe haven flows.

Upside risks to current forecasts for UK gilt yields and PWLB rates

- **UK** - a significant rise in inflationary pressures e.g. caused by a stronger than currently expected recovery in the UK economy after effective vaccines are administered quickly to the UK population, leading to a rapid resumption of normal life and return to full economic activity across all sectors of the economy.
- The **Bank of England is too slow** in its pace and strength of increases in Bank Rate and, therefore, allows inflationary pressures to build up too strongly within the UK economy, which then necessitates a rapid series of increases in Bank Rate to stifle inflation.
