Economic Background – Link Asset Services Ltd

UK. Economic growth 2020 started with optimistic business surveys pointing to an upswing in growth after the ending of political uncertainty as a result of the decisive result of the general election in December settled the Brexit issue. However, the three monthly GDP statistics in January were disappointing, being stuck at 0.0% growth. Since then, the whole world has changed as a result of the coronavirus outbreak. The overall growth rate in quarter 1 was -2.2%, -1.7% y/y. However, the main fall in growth did not occur until April when it came in at -24.5% y/y after the closedown of whole sections of the economy. What is uncertain, however, is the extent of the damage that will have been done to businesses by the end of the lockdown period, how consumer confidence and behaviour may be impacted afterwards, whether there could be a second wave of the outbreak, how soon a vaccine will be created and then how quickly it can be administered to the population. This leaves huge uncertainties as to how quickly the economy will recover to what was formerly regarded as normality. However, some changes during lockdown are likely to be long lasting e.g. a shift to online purchasing, working from home, etc. The lockdown has also had a sharp effect in depressing expenditure by consumers which means their level of savings have increased and debt has fallen. This could provide fuel for a potential surge in consumer expenditure once some degree of normality returns.

Although the UK left the EU on 31 January 2020, we still have much uncertainty as to whether there will be a reasonable trade deal achieved by the end of 2020. At the end of June, the UK government rejected extending the transition period beyond 31 December 2020. This has increased the chances of a no-deal **Brexit**. However, the most likely outcome is expected to be a slim deal on trade in order to minimise as much disruption as possible. However, uncertainty is likely to prevail until the deadline date which will act as a drag on recovery.

After the Monetary Policy Committee left **Bank Rate** unchanged at 0.75% in January 2020, the onset of the coronavirus epidemic in March forced it into making two emergency cuts in Bank Rate first to 0.25% and then to 0.10%. These cuts were accompanied by an increase in **quantitative easing (QE)**, essentially the purchases of gilts (mainly) by the Bank of England of £200bn. In June, the MPC decided to add a further £100bn of QE purchases of gilts, but to be implemented over an extended period to the end of the year. The total stock of QE purchases will then amount to £745bn. It is not currently thought likely that the MPC would go as far as to cut Bank Rate into negative territory, although the Governor of the Bank of England has said all policy measures will be considered. The Governor also recently commented about an eventual tightening in monetary policy – namely that he favours unwinding QE before raising interest rates. Some forecasters think this could be as far away as five years.

The Government and the Bank were also very concerned to **stop people losing their jobs** during this lockdown period. Accordingly, the Government introduced various schemes to subsidise both employed and self-employed jobs for three months to the end of June while the country is locked down. It also put in place a raft of other measures to help businesses access loans from their banks, (with the Government providing guarantees to the banks against losses), to tide them over the lockdown period when some firms may have little or no income. However, at the time of writing, this leaves open a question as to whether some firms will be solvent, even if they take out such loans, and some may also choose to close as there is, and will be, insufficient demand for their services. The furlough scheme was subsequently

extended for another three months to October, but with employers having to take on graduated increases in paying for employees during that period. **The Bank of England expects the unemployment rate to double to 8%.**

The Government measures to support jobs and businesses will result in a **huge increase in the annual budget deficit for the current year, from about 2% to nearly 17%**. **The ratio of debt to GDP is also likely to increase from 80% to around 105%**. In the Budget in March, the Government also announced a large increase in spending on infrastructure; this will also help the economy to recover once the lockdown is ended. Economic statistics during June were giving a preliminary indication that the economy was recovering faster than previously expected. However, it may be a considerable time before economic activity recovers fully to its previous level.

Inflation. The annual inflation rate dropped to 0.5% in May from 0.8% in April and could reach zero by the end of the year. **Inflation rising over 2% is unlikely to be an issue for the MPC over the next two years as the world economy will be heading into a recession;** this has caused a glut in the supply of oil which initially fell sharply in price, although the price has recovered somewhat more recently. Other UK domestic prices will also be under downward pressure; wage inflation was already on a downward path over the last half year and is likely to continue that trend in the current environment where unemployment will be rising significantly. In May's Monetary Policy Report, the Bank of England predicted that inflation would hit their 2% target by 2022. This was in the context of its forecast that GDP would rise by 3% in 2022 after a recovery during 2021. **While inflation could even turn negative in the Eurozone, this is currently not likely in the UK.**

USA. Growth in quarter 1 of 2020 fell by an annualised 5.0% and will fall sharply in quarter 2. Once coronavirus started to impact the US in a big way, the Fed took decisive action by cutting rates twice by 0.50%, and then 1.00%, in March, all the way down to 0.00 – 0.25%. Near the end of March, Congress agreed a \$2trn stimulus package (worth about 10% of GDP) and new lending facilities announced by the Fed which could channel up to \$6trn in temporary financing to consumers and firms over the coming months. Nearly half of the first figure is made up of permanent fiscal transfers to households and firms, including cash payments of \$1,200 to individuals. The loans for small businesses, which convert into grants if firms use them to maintain their payroll, will cost \$367bn and 100% of the cost of lost wages for four months will also be covered. In addition there was \$500bn of funding from the Treasury's Exchange Stabilization Fund which will provide loans for hard-hit industries, including \$50bn for airlines.

Non-farm payrolls unexpectedly increased by 2.5 million jobs in May, beating market expectations of an 8 million fall, and after declining by a record 20.7 million in April. The figures suggest that the economic recovery in the US may happen much faster than initially expected. Some states started reopening in mid-May after a two-month shutdown but a few have had to reimpose localised lockdowns since then.

EUROZONE. The Eurozone economy shrank by 3.6% on quarter in the first three months of 2020. So far, the ECB has been by far the most important institution in helping to contain the impact of coronavirus and the crisis on financial markets. Since 12th March, it has implemented a range of new policies including providing additional cheap loans for commercial banks and easing capital requirements for the banking sector. But most importantly, the ECB has stepped up and reformed its asset

purchase programmes. So far, it has increased its planned asset purchases for this year by €1,470bn on top of the €20bn per month which it was already committed to. The new purchases consist of an additional €120bn within the existing Public Sector Purchase Programme (PSPP), and €1,350bn in the Pandemic Emergency Purchase Programme (PEPP). At its 4 June monetary policy meeting, the ECB Governing Council also committed to continue net asset purchases under the PEPP until at least the end of June 2021 and to continue to reinvest maturing principal payments under the PEPP until at least end-2022. It has also made clear that it would not hesitate to top up PEPP as much as needed to contain the risk of a crisis.

Just as important as the size of the PEPP is its flexibility. Whereas previous asset purchase programmes adhered to strict issuer limits, the PEPP was designed to be flexible across “time, asset classes and jurisdictions”. This means that the ECB can act in the interests of the euro-zone as a whole rather than having to treat each national bond market equally. However, while this overall programme will provide protection over the next year or so, some vulnerable countries, particularly Italy, already started the crisis with a high level of debt to GDP and the crisis will make that level even worse at the same time as GDP growth prospects will have worsened. This leaves a big question over ‘what happens after then when financial markets will be concerned that those debt levels are unsustainable?’

What is currently missing is a major coordinated EU response of fiscal action by all national governments to protect jobs, support businesses directly and promote economic growth by expanding government expenditure on e.g. infrastructure. The EU’s recently-proposed rescue fund, (officially designated “Next Generation EU”), is a major first step towards financial integration in the EU. However, it is striking just how small this package is as the proposed €500 billion of grants amount to about 0.6% of average annual euro-zone GDP (over the seven-year budget period). It will therefore supply relatively little support to the weaker and more vulnerable countries within the EU. This has therefore left individual national governments to implement a patchwork of support measures within each country. This shows up how far away the EU is from being an effective fiscal union.

CHINA. Economic growth has been weakening over successive years, despite repeated rounds of central bank stimulus; medium-term risks have also been increasing. The major feature of 2019 was the trade war with the US. However, this has been eclipsed by being the first country to be hit by the coronavirus outbreak; this resulted in a lockdown of the country and a major contraction of economic activity in February-March 2020. The Chinese economy shrank 6.8% y/y in Q1 2020, following 6% y/y growth in Q4 of 2019. Ongoing economic issues remain, in needing to make major progress to eliminate excess industrial capacity and to switch investment from property construction and infrastructure to consumer goods production. It also needs to address the level of non-performing loans in the banking and credit systems. The post Covid government measures to stimulate more infrastructure investment are likely to result in an increase in inefficient low reward investment.

JAPAN has been struggling to stimulate consistent significant GDP growth for years and to get inflation up to its target of 2%, despite huge monetary and fiscal stimulus. It is also making little progress on fundamental reform of the economy. Japan appears to have escaped the worst effects of the virus - as yet.

WORLD GROWTH. The trade war between the US and China on tariffs was a major concern to financial markets and was depressing worldwide growth during 2019. This year, coronavirus is the inevitable big issue which is going to sweep around most countries in the world and have a major impact in causing a world recession in growth in 2020.
